# a365-toolkit

Preparing the security services that support Agent 365.

**PURPOSE**

Give administrators a controlled way to deploy, configure and verify supporting security services, with explicit approval and evidence at each stage.

## SERVICE COVERAGE

| SERVICE | CAPABILITY | DELIVERY |
|---|---|---|
| **Entra** | Agent Conditional Access, scoped rollout and control verification. | Narrow CA workflow |
| **Defender** | Security integrations, connector readiness and agent visibility. | Partial automation |
| **Purview** | Audit enablement and scoped data loss prevention policies. | Audit + DLP simulation |
| **Sentinel** | Ingestion, hunting, detections, workbooks and response preparation. | Starter deployment pack |

## ADMINISTRATOR CONTROL

Select the tenant and scope. Review existing settings and proposed changes. Approve the exact plan, deploy supported components, and verify configuration and runtime results. Approve enforcement separately.

## DELIVERY APPROACH

Qualify workflows in development and sandbox tenants before production rollout. Expand service coverage and consolidate planning, execution, recovery and drift review into one administrator experience.

Available today: service-specific executors and a shared command entry point.
Planned: cross-service orchestration, broader coverage and production qualification.
